MONTHLY

\$317.63

at the hours below

ANNUAL (x12)

\$3,811.55

projection

SAVED BY SCHEDULING

\$38.15

per month vs 24/7

Cost by environment

Each environment is priced for the hours it actually runs. Non-production shut down outside working hours costs proportionally less.

Environment	Runs	Monthly	Annual (x12)	Share
Production	24h/day	\$290.38	\$3,484.51	91%
Staging	12h of 24h/day	\$16.35	\$196.22	5%
Dev	8h of 24h/day	\$10.90	\$130.82	3%

Total across environments: **\$317.63** per month, **\$3,811.55** per year.

Detailed breakdown

Production - \$290.38/mo

Service	Configuration	How it was calculated	Monthly	Annual
Amazon EC2	t3.large x2, On-Demand, Linux, web tier	$\$0.0896/\text{hr} \times 730 \text{ hrs/month} \times 2 = \$130.82/\text{mo}$	\$130.82	\$1,569.79
Amazon RDS for PostgreSQL	db.t3.medium, Multi-AZ, On-Demand, 100GB GP3 storage	$\$0.2120/\text{hr} \times 730 \text{ hrs/month} = \$154.76/\text{mo}$	\$154.76	\$1,857.12
Amazon S3 Standard	200 GB Standard storage	$\$0.0240/\text{GB-month} \times 200 \text{ GB} = \$4.80/\text{mo}$	\$4.80	\$57.60

Staging - \$16.35/mo

Service	Configuration	How it was calculated	Monthly	Annual
Amazon EC2	t3.medium x1, On-Demand, Linux	$\$0.0448/\text{hr} \times 12\text{h/day} (365.0 \text{ of } 730 \text{ hrs/month}) = \$16.35/\text{mo}$	\$16.35	\$196.22

Service	Configuration	How it was calculated	Monthly	Annual
Amazon EC2	t3.small x2, On-Demand, Linux, off at weekends	$\$0.0224/\text{hr} \times 8\text{h/day} \times 243.3 \text{ of } 730 \text{ hrs/month} \times 2 = \$10.90/\text{mo}$	\$10.90	\$130.82

Monthly figures use AWS published on-demand rates for the stated region, multiplied by the hours each resource runs. Annual is the monthly cost x 12 - a projection for budgeting, not a quoted annual price, and it assumes the configuration does not change.

Saving from scheduled shutdown

Running non-production on a schedule instead of 24/7 avoids about \$38.15 per month, or \$457.86 per year.

Service	Environment	Hours/day	Billed monthly	Avoided
Amazon EC2	Staging	12h of 24h	\$16.35	\$16.35
Amazon EC2	Dev	8h of 24h	\$10.90	\$21.80

Projected saving against always-on, derived from the priced monthly cost and the configured hours per day. It is not a separate AWS quote. Only time-billed resources are counted: usage-based services such as S3 storage or per-request charges cost the same whether the environment is running or not.

Assumptions and exclusions

Chosen on your behalf where the requirement did not say:

#	Assumption
1	Region ap-south-1 used for all resources as specified/defaulted
2	On-Demand pricing used for all EC2 and RDS resources since no commitment/pricing model was specified by the user
3	Linux OS assumed for all EC2 instances
4	RDS storage sized at 100GB General Purpose SSD (gp3) as a defensible default since the sheet did not specify storage size (not separately priced as it wasn't a listed resource row)
5	S3 200GB assumed already resident in S3 Standard with no PUT/GET request volume specified, so only storage cost is priced
6	Dev EC2 "off at weekends" was interpreted purely as the 8 hours/day runtime figure already given; no additional weekly-day reduction was applied beyond the stated hoursPerDay

This estimate excludes:

- Data transfer beyond what was specified above, including inter-region and internet egress.
- AWS Support plans, Marketplace software, and third-party licensing.
- Taxes, and any private pricing or Enterprise Discount Program terms on your account.
- One-off migration, professional services, and engineering effort.

AWS recalculates live pricing when the estimate link is opened, so the figures here are correct as at 17-08-2026 and may move with published price changes.
